BRIEF DESCRIPTION OF THE FIGURES

The Figure represents the catalytic iron content (nmol/mg urinary creatinine) in urine obtained from humans with no kidney disease (control), with diabetic microalbuminuria (DM Micro), diabetic (DM) proteinuria, glomerulonephritis (~~GM~~) (GN) and ischemic nephropathy.

Please replace the paragraph at page 17, line 22 through page 18, line 3 with the following amended paragraph:

The phrase “reducing the severity” (also referred to herein as a reduction in the severity) when referring to a progressive kidney disease means any diminution, amelioration or decrease in progressive damage to the kidney that compromises the function of the kidney. Well- recognized indices to assess function of the kidney can be employed to determine a reduction in the severity of the kidney disease. These indices can include, for example, a reduction in protein content in urine, a reduction in blood urea nitrogen, a reduction in serum or plasma creatinine, ~~a decline an~~ increase in glomerular filtration rate, a delay in the onset of end-stage renal disease, or any combination thereof, compared to a sample obtained from the human prior to administering the iron chelator, or a control sample.
